Art Unit: 2164

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 5-7 are rejected under 35 U.S.C. 102(e) as being anticipated by Kawamura et al. (U.S. Patent 6,075,920).

Claim 5: The time code generating portion (9) and the generating portion indicated by the right arrow extending from the control unit (20) are readable as toggle generating portions since they generate subcode components (i.e. “subcode P data”) which are delivered to the subcode encoder (11). The subcode can be said to “toggle” in the sense that it is created by changing a field of bits to a different field of bits. For example, FIG. 18 indicates that the subcode for the track number occupies a field having a length of 2 bytes. The field is inherently changed when the field gets encoded with track number information. Thus, the subcode field containing this information can be said to toggle between an uncoded “low state” and an encoded “high state”. The control unit (20) reads as the selecting portion since it maintains control over the entry of subcode components into the subcode encoder (11).

No patentable weight is attributable to the wherein clause (last paragraph) that the time interval between high and low states is predetermined and regular, since this pertains to the intended usage of the circuit rather than defining physical features of the circuit.

Claim 6: The amount of time required to change from the un-coded state to the encoded state corresponds to the claimed period.

Art Unit: 2164

Claim 7: The control unit is the selecting portion since it maintains control over the entry of subcode components, which in turn generate encoded output which is written to a data recoding medium (19), as seen in FIG. 1.

Claims 3-4 and 8-12 are allowed.

This action follows the filing of an RCE request and is made non-final.

Remarks

Claims 3-4 and 8-12 are allowed. Claims 5-7 remain rejected under 35 USC 102(e) for the reasons as recited above. This action is made non-final.
